"My rule table started on Gerber, but I had to recreate it on the StyleCAD.

StyleCAD's rule table exists as a table within a database file.
This file can be read and opened by Microsoft access. You can create the table in excel and then import it into the database via access. The ability to do this is **one of the great things I love about StyleCAD's Grade rules**.
I can use the same spreadsheet to generate the same rules but in different step ratios all thanks to the formulas in excel...

With StyleCAD I set up the spreadsheet in a few hours and now I can add similar grade rule libraries in a matter of minutes.
So long as the steps as a proportion of a full grade it's super quick to create a full library of 3000 grade rules.
StyleCAD also allows you to **quickly add new rules** to the library as you work, and you can have letters as well as numbers....

It's much faster to apply the grade rules after digitising in StyleCAD.
With Gerber you add them as you go around the piece on the digitiser.
With StyleCAD's ability to select multiple points and assign grade rules to them it's **much much faster** to assign the rules once it's on the screen.

Digitising on StyleCAD is much faster than Gerber. There are **huge staff time/cost savings** to be made just with the digitising alone."
